

ABSTRACT

A removable spinning hubcap that provides the appearance of the rim turning when the vehicle is not in motion. The invention discloses inner and outer members that are connected by a bearing. The inner member can be connected to an existing or custom tire rim. When the vehicle is in motion the turning of the inner rim exerts rotational motion to the inner member and then turns the outer member. Bearings are provided between the two members that allow the outer member to spin freely from the rotational inertial after the inner member changes rotational speed.
